

# Scenario planning across planning & forecasting platforms

Our own solution set against eleven competitors on the scenario-planning capabilities that decide whether a what-if actually changes a plan — plus the personas who build and consume scenarios, and the job scenario planning does for each of them.

## Overview

### 01 Four classes, four definitions of “scenario”

The word “scenario” means genuinely different things across these products, and conflating them produces nonsense comparisons. In a planning platform a scenario is a modelled version of the future with its own driver assumptions. In revenue intelligence it is usually a forecast *category* — commit versus best case — not a modelled alternative at all.

|                                                                                                                                                                                                          |                                                                                                                                                                          |                                                                                                                                                                                                      |                                                                                                                                    |

### 02 The three findings that matter

|                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FINDING 01</b><br><b>Time-to-scenario is the real battleground</b><br><br>Pigment’s rise is largely explained by one thing: a business user creates and compares a case in seconds. At most incumbents a genuinely new scenario needs a model change, a modeller and a queue — which pushes the analysis back into Excel and costs the platform the workflow it was bought for. | <b>FINDING 02</b><br><b>Goal-seek is rare, and it inverts the question</b><br><br>Among the competitors only Oracle’s Strategic Modeling treats back-solving as first-class. It changes the user’s question from “what happens if I move this driver” to “what must be true to hit my target”, which is what executives actually ask. Almost nobody else offers it as a casual act. | <b>FINDING 03</b><br><b>Scenarios die in the sandbox</b><br><br>The path from a chosen scenario back into the committed plan — as a reviewable, unsaved change with deltas and an audit trail — is unsolved across the competitor field. So is having an agent propose the scenario worth looking at. Aera is the only competitor pointing at either, and both are where our own build is rated strong. That is the wedge. |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 03 How to read the matrix

Capabilities are labelled by competitive status rather than counted. **TABLE STAKES** means every serious planning platform has it. **DIFFERENTIATOR** means it separates leaders today. **WHITE SPACE** means no competitor has convincingly solved it. Status is judged on the competitor field alone; our own column sits alongside as the reference, not as evidence.

|                                                   |                                                                        |                                     |
|---------------------------------------------------|------------------------------------------------------------------------|-------------------------------------|
| <b>Strong</b> first-class, a reason customers buy | <b>Partial</b> present but shallow, or needs a modeller / another tool | <b>Limited</b> absent or incidental |
|---------------------------------------------------|------------------------------------------------------------------------|-------------------------------------|

Aviso AI

REVENUE INTEL

What-if levers over an AI forecast, with ranges standing in for discrete scenarios.

SIGNATURE SCENARIO MOVE

What-if modelling on win rates and deal outcomes, wrapped in a confidence range.

Open profile →

BoostUp.ai

REVENUE INTEL

Forecast adjustments and pipeline what-ifs; scenario depth is not the point.

SIGNATURE SCENARIO MOVE

Adjusted forecast submissions compared against the system number.

Open profile →

Weflow

REVENUE INTEL

Effectively no scenario planning — roll-up adjustments and hygiene.

SIGNATURE SCENARIO MOVE

Manual forecast roll-up adjustment against the CRM number.

Open profile →

HubSpot

CRM

Goal versus forecast, and little else — deliberately not a scenario platform.

SIGNATURE SCENARIO MOVE

Forecast against goal, with manual category adjustment.

Open profile →

Screenshots

01 What scenario planning actually looks like

Our own scenario drawer first, then one visual per competitor, each chosen to show that vendor's scenario mechanism rather than its prettiest dashboard — Oracle's goal-seek solving inside the account view, Pigment's two scenarios as adjacent columns, SAP's Promote control on a named scenario, Aviso's scenario buckets against plan. Where a vendor's scenario capability is genuinely thin, the picture says so. Click any tile for the full vendor profile.

- All classes 11
- Enterprise planning platforms 5
- Decision intelligence 1
- Revenue intelligence 4
- CRM-native reporting 1

Counts are competitors; Salesforce CPM is pinned first and always shown

Salesforce CPM

OURS

Four named scenarios as adjacent columns — **Baseline** (Current Trend), **Market Defender** (Conservative · Protective), **Efficiency Maximizer** (Profit-Led) and **Growth Disruptor** (Aggressive · Signal-Led), the last selected and highlighted. The DRIVERS block above states the levers in business language — Price Concession “Match Competitor (6%)” against “Aggressive (12%)”, Target Margin “Protect (24%)” against “Stretch (19%)”, Rebate Tier 1 through 3 — with the baseline’s own drivers greyed because it is the reference. Beneath it the OUTCOMES rows — quantity, revenue and margin down to cannibalisation — each carry a value and a signed delta, so the trade-off reads down a single column: Growth Disruptor buys 103,768 units (+22.1%) but takes net profit margin from 18.5% to **16.6%**, adds 24.5% of price-concession cost and pulls \$3.8K out of the adjacent line. The Growth / Price / Volume sliders (+12%, −2%, +9%) retune the selected scenario in place.

OUR OWN PRODUCT — INTERNAL SCREENSHOT

Internal report ↗

Anaplan

PLANNING

Anaplan’s **Compare** tool colour-coding every value in a module against a chosen base — green above, red below — so the delta reads without arithmetic. Anapedia’s example sets the base to a department; the same control accepts a previous or different *version* as the base, and versions are how Anaplan holds scenarios. Honest caveat: this is the comparison mechanism, not a scenario-manager screen — Anaplan publishes no public shot of one.

VENDOR SCREENSHOT Source ↗

Pigment

PLANNING

Two scenarios in one Pigment view. The *Growth Rate by Product* grid carries **Default** and **Worst Case** as adjacent columns (6% against 2%), and the *Orders* metric plots both as separate series. Both blocks are stamped “Scenario: 2 Scenarios” — the driver change and its consequence on one screen, which is precisely the claim Pigment is built on.

VENDOR SCREENSHOT Source ↗

Goal Seek solving inside Strategic Modeling. The target is set on the right — Product Sales of **1,100** in 2024 under the **Expansion** scenario — Unit Volume is nominated as the account to move across 2023–2026, and the solver returns the required adjustment of 17.26. Impacted cells turn yellow and a Goal Seek Results panel opens beneath the account view. Note the Scenario selector top-left: scenario is a dimension here, not a copy of the model.

VENDOR SCREENSHOT [Source ↗](#)

The o9 Demand Review workbench with risks and opportunities loaded into the simulation. The waterfall walks Outlook LY through Planned Growth and Target to the unconstrained outlook, then layers **Total Opportunity** and **Total Risk** to produce “Uncons Outlook with R&O” and “Included Project”. Gap-to-target (−4.1%) sits above. This is what an o9 scenario is: modelled increments propagated across the network, not a separate copy of the plan.

VENDOR SCREENSHOT [Source ↗](#)

SAP IBP’s **Manage Scenarios** dialog in the Excel add-in: named user-defined scenarios (“Lost Key Account”, “New Customer Account”) held against the Base Version, each shared with specific users, each with explicit **Promote**, Reset, Delete and Duplicate controls. Promote is the write-back-into-the-plan step almost nobody else here exposes. Sourced from SAP Press rather than help.sap.com, whose scenario pages carry no screenshots.

VENDOR SCREENSHOT [Source ↗](#)

Aera Technologies

DECISION INTEL

Aera’s Decision Workbench — the prioritised recommendation queue. Said plainly: this is *not* a scenario screen, it is the only public product imagery Aera publishes. Aera’s actual scenario mechanism, the simulated impact of accepting a recommendation, sits one click inside a card and behind a login. The queue is still the right picture of the model: you approve a scenario the system proposed rather than building one.

VENDOR SCREENSHOT [Source ↗](#)

Clari

REVENUE INTEL

Clari’s Forecast module with the categories doing the work of scenarios: **Plan, Booked, Gap to Go, Commit, Upside, Pipeline** as parallel columns down the sales hierarchy. The right panel is the interesting part — a CRO Commit of \$72.0M sitting against an Adjusted Rollup of \$59.9M and a Team Rollup of \$71.6M. A judgement case reconciled to the arithmetic case, which is as close to scenario modelling as revenue intelligence gets.

VENDOR SCREENSHOT [Source ↗](#)

Aviso AI

REVENUE INTEL

Aviso’s Scenarios workspace, and the most literal scenario UI in the revenue-intelligence class: “Best Case Scenario”, **2 of 5** saved scenarios, measured against a \$100M plan with Scenario Total \$82.3M, **Gap to Plan \$17.7M** and a star-rated Scenario Health. Deals move between Won / DLF / Commit / Best Case / Most Likely buckets and the roll-up re-totals, with Aviso recommendations attached to each bucket.

VENDOR SCREENSHOT [Source ↗](#)

BoostUp.ai

REVENUE INTEL

BoostUp’s Opportunities view with the **Forecast Category** column open for override — the system value struck through and the human call (“Most Likely” over “Best”, “Commit” over “Upside”) written above it, deal by deal. That adjustment layer against the system number *is* BoostUp’s scenario. Reproduced at the modest resolution BoostUp’s help centre publishes.

VENDOR SCREENSHOT [Source ↗](#)

Weflow

REVENUE INTEL

Weflow’s domain does not resolve and no product screenshot is retrievable, so this is a recreation of the roll-up its documentation describes: the CRM number per team, the manager’s adjustment beside it, and the submitted call. There is no scenario object, no driver lever and nothing to compare — which is the finding, not an omission. Deliberately plain, because the product is.

ILLUSTRATIVE RECREATION — NOT A VENDOR SCREENSHOT

[Source ↗](#)

HubSpot

CRM

HubSpot’s Forecast tool on the **Forecast category** tab: goal attainment, coverage ratio, total, pipeline, best case, commit and forecast submission, per rep. Amounts are masked in HubSpot’s own published asset, so the bars are placeholders. The point stands regardless — the categories are labels applied to deals, not modelled cases, and forecast-against-goal is the entirety of HubSpot’s scenario story.

VENDOR SCREENSHOT [Source ↗](#)

**Attribution and fair use.** The first tile is our own product — an internal screenshot of the Salesforce CPM prototype, not a published vendor image — and it is there as the reference the rest are read against. Of the 11 competitor visuals that follow, 10 are genuine product screenshots published by the vendors themselves — on their documentation, help centres, community sites or product pages — and every tile links back to the exact public page it came from. They remain the property of their respective owners and are reproduced here purely as illustration for internal competitive commentary. The remaining one is an illustrative recreation, labelled as such, drawn from the vendor’s own written description because no public screenshot was obtainable. Where an image shows something other than scenario functionality, the caption says so rather than implying otherwise.

Capability matrix

01 Capability matrix

Twelve scenario-planning capabilities as rows; our own solution in the first, highlighted column, then eleven competitors. Strip out the table stakes to see what actually separates these products.

☐ Differentiators & white space only

☐ Highlight only “Strong” ratings

01 Personas, goals, and what scenario planning does for them

Twelve personas across the planning lifecycle. For each: the decision they own, the scenario capabilities that actually serve it, and the requirement that separates a useful scenario from an abandoned sandbox.

- All personas 12
- Finance 2
- Strategy 1
- S&OP 1
- Supply chain 2
- Sales 2
- RevOps 1
- Commercial 1
- Platform 1
- Executive 1

FP&A Analyst

FINANCE

USE CASE

Build and compare the cases

GOAL

Produce two or three defensible cases quickly and explain the trade-off between them.

SCENARIO CAPABILITIES THAT SERVE IT

- Self-service scenario creation
- Driver levers
- Side-by-side comparison with deltas
- Sensitivity ranking

WHAT MAKES IT WORK

Time-to-scenario is everything. If a new case needs a modeller and a two-day queue, the analysis happens in Excel instead and the platform loses the workflow.

CFO / Finance Leader

FINANCE

USE CASE

Choose a case and protect the downside

GOAL

Pick a case to commit to, knowing the downside and what would have to be true.

SCENARIO CAPABILITIES THAT SERVE IT

- KPI comparison matrix
- Scenario range (base / upside / downside)
- Goal-seek to a target
- Cash and margin bridges

WHAT MAKES IT WORK

One screen with the KPIs that matter by scenario. Three cases and the gap — not forty measures spread across dashboards.

Corporate Strategy / LRP

STRATEGY

USE CASE

Long-range and structural cases

GOAL

Evaluate market entry, capacity investment or M&A over a multi-year horizon.

SCENARIO CAPABILITIES THAT SERVE IT

- Long-range scenario modelling
- Sensitivity / tornado
- Probabilistic range
- Driver trees

WHAT MAKES IT WORK

Must handle structural change — new entities, step-function capacity — not just percentage tweaks to existing drivers.

S&OP / IBP Lead

S&OP

USE CASE

Monthly consensus scenario

GOAL

Land one reconciled cross-functional case with an auditable decision log.

SCENARIO CAPABILITIES THAT SERVE IT

- Scenario comparison with deltas
- Constrained feasibility check
- Bridge from prior cycle
- Governance / approval trail

WHAT MAKES IT WORK

Governance is the job. The cycle needs to end with one locked, approved scenario and a record of who agreed to what.

Demand Planner

SUPPLY CHAIN

USE CASE

Demand upside and downside

GOAL

Quantify plausible demand cases and flag where the range is widest.

SCENARIO CAPABILITIES THAT SERVE IT

- Statistical forecast with interval
- Driver levers (promo, ramp, seasonality)
- Scenario vs baseline overlay

WHAT MAKES IT WORK

Must separate the statistical baseline from human scenario overrides so each override stays auditable.

Supply / Production Planner

SUPPLY CHAIN

USE CASE

Feasibility under constraints

GOAL

Establish whether a demand case can actually be produced and shipped.

SCENARIO CAPABILITIES THAT SERVE IT

- Constrained optimisation
- Capacity utilisation by scenario
- Inventory projection vs target
- Exception alerts

WHAT MAKES IT WORK

Constraints must be enforced inside the scenario. An infeasible scenario that still balances arithmetically is worse than no scenario.

Key Account Manager / Seller

SALES

USE CASE

Account-level what-if

GOAL

Test what a customer programme change does to the account commitment.

SCENARIO CAPABILITIES THAT SERVE IT

- Driver levers at account level
- Side-by-side vs current plan
- Promote scenario into the plan

WHAT MAKES IT WORK

Must run at the row being edited and be promotable into the plan as a reviewable, unsaved change — not a disconnected sandbox.

Sales VP / CRO

SALES

USE CASE

Commit, upside and risk case

GOAL

Submit a number with an explicit upside and downside case behind it.

SCENARIO CAPABILITIES THAT SERVE IT

- Multi-category roll-up as scenarios
- Coverage / win-rate what-if
- Forecast waterfall between states

WHAT MAKES IT WORK

Each case needs a named owner and a reconciliation to the last one, or the range reads as hedging rather than analysis.

Sales / Revenue Operations

REVOPS

USE CASE

Capacity, quota and territory cases

GOAL

Model hiring ramp, quota and territory options and their coverage effect.

SCENARIO CAPABILITIES THAT SERVE IT

- Driver-based capacity model
- Scenario comparison
- Sensitivity on ramp and attrition

WHAT MAKES IT WORK

Needs headcount and ramp as real drivers with lag, not a flat percentage applied to a total.

Business Unit GM / P&L owner

COMMERCIAL

USE CASE

Own the trade-off

GOAL

Decide between growth and margin options for the unit and defend the choice.

SCENARIO CAPABILITIES THAT SERVE IT

- KPI comparison matrix
- Goal-seek to a margin target
- Contribution by driver

WHAT MAKES IT WORK

Comparison must span both revenue and cost consequences; a revenue-only scenario hides the decision being made.

Data / Platform Admin

PLATFORM

USE CASE

Scenario hygiene and sprawl

GOAL

Keep scenarios governed, performant and trustworthy as they multiply.

SCENARIO CAPABILITIES THAT SERVE IT

- Scenario inventory and lineage
- Version audit
- Recalculation performance

WHAT MAKES IT WORK

Needs lifecycle control — archive, lock, expire — or scenario sprawl quietly destroys trust in every number.

Executive / Board

EXECUTIVE

USE CASE

Range and downside oversight

GOAL

Understand the range of outcomes and the trigger points between cases.

SCENARIO CAPABILITIES THAT SERVE IT

- Scenario range summary
- Trigger / threshold markers
- Plan attainment by scenario

WHAT MAKES IT WORK

Wants the decision and its triggers — “if orders fall below X we move to the downside case” — not the underlying model.

Where to win

01 Table stakes, differentiators, white space

The same twelve capabilities, sorted by what they are worth competitively. The “strong” list names competitors only; the teal chip on the right of each line is where we stand today.

Table stakes (1)

Every serious planning platform has it.

- Named scenarios as first-class objects (versions) — strong: Anaplan, Pigment, Oracle, o9 Solutions, SAP

OURS: STRONG

Differentiators (8)

Separates leaders from followers today.

- Self-service scenario creation (no modeller required) — strong: Pigment OURS: STRONG
- Driver-based, business-semantic assumption levers — strong: Anaplan, Pigment, Oracle, o9 Solutions, SAP OURS: STRONG
- Side-by-side scenario comparison with deltas — strong: Anaplan, Pigment, o9 Solutions OURS: STRONG
- KPI comparison matrix across scenarios — strong: Pigment, o9 Solutions OURS: STRONG
- Goal-seek / back-solve to a target — strong: Oracle OURS: STRONG
- Sensitivity analysis (what matters most) — strong: Oracle, o9 Solutions OURS: PARTIAL
- Constrained / feasible-scenario optimisation — strong: Anaplan, o9 Solutions, SAP OURS: LIMITED
- Scenario governance (approval, audit, lock, lineage) — strong: Anaplan, Oracle, SAP OURS: PARTIAL

White space (3)

No competitor has convincingly solved it.

- Probabilistic / Monte Carlo ranges — no vendor rated strong OURS: LIMITED
- Promote a scenario into the committed plan (write-back) — strong: Aera Technologies OURS: STRONG
- AI-proposed scenarios / agent-recommended what-if — strong: Aera Technologies OURS: STRONG

02 Implications

DO THIS

Make a scenario a seconds-long act

Named business-semantic levers a planner can move without a model change. If creating a case requires anyone else’s help, it will not happen during the review meeting where it matters.

DO THIS

Ship goal-seek as a first-class inversion

Let a user type the outcome they need and back-solve the drivers within feasible bounds. It is the rarest capability in the set, it maps to how leadership actually asks the question, and it is a demonstrable wedge against everyone except Oracle.

DO THIS

Close the loop into the plan

Promote the chosen scenario into the grid as edited and impacted cells with visible deltas, a note, and an explicit save step. That single move converts scenario planning from an analysis side-quest into the way the plan actually gets changed — no competitor here has done it, and it is the one thing our own build already does end to end.

**Read this with care.** Leader lists and “no vendor rated strong” count competitors only; the teal chip beside each capability is our own rating, and it is a self-assessment of a working prototype rather than a shipped, scaled product — treat it as the least independent number on the page. Ratings are an analytical judgement from working product knowledge, not a vendor datasheet. Scenario capability is especially sensitive to module and licence tier — Oracle’s goal-seek lives in Strategic Modeling, SAP’s simulation in IBP with visuals in Analytics Cloud, and Anaplan’s constrained solving in Optimizer, each licensed and implemented separately. The revenue-intelligence vendors use “scenario” to mean forecast categories rather than modelled alternatives, so their ratings should be read as “good at what they claim”, not “weak planning tools”.

Our own solution against 11 competitors · 12 scenario capability dimensions · 12 personas · 11 competitor screenshots (10 genuine, 1 illustrative recreation) plus one internal screenshot of our own build · analytical judgement, not a vendor datasheet
