

◆ Predicted Baseline Quantity

A committed forecast tells you where you are today. The AI-generated **Predicted Baseline** tells you where demand is *heading* – projecting each account and program forward from curated history, floored by committed agreements and lifted by stage-weighted pipeline.

14.73M ◆ Predicted Baseline Qty (FY26)	13.84M Forecast Qty – committed (FY26)	+26% Midwest Assembly · Jan → Dec	+1% Southwest Stamping · Jan → Dec
--	--	---	--

◆ Agentforce · Forecast & Risk Agent

Generates the Predicted Baseline curve and a confidence band, then flags that the Midwest e-motor housing ramp is trending well above committed agreement volume – a risk a manual sum would hide. **It recommends; the Key Account Manager decides.**

A calculated sum, and next to it an AI projection

Forecast Quantity is a calculated measure – the sum of Sales Agreement, Opportunity and Order Quantity – updating as the underlying data changes. Directly beneath it sits **◆ Predicted Baseline Quantity**: an AI model projects demand forward from the historical order data Admins curated in Data Cloud through DPE transforms, capturing trend and seasonality.

Same account hierarchy, expanded on the Predicted Baseline measure: North America → Light Trucks → the two agreement plants.

Predicted Baseline – monthly, by plant

- ▲ EV ramp building At Midwest, the model bends sharply upward – 46.8K → 58.9K (+26%).
- Steady legacy At Southwest, it stays flat – ~21.2K all year (+1%).
- A simple committed sum could never show that difference in trajectory.

The e-motor housing program is the sharpest – and the riskiest

Show in grid

Midwest Assembly expanded to programs. Powertrain and Electronics lift moderately; **E-Motor Housing** ramps the steepest.

Predicted Baseline – monthly, Midwest programs

- ▲ +50% E-Motor Housing climbs **10.1K** → **15.1K** across FY26.
- ! Low confidence It's a brand-new program with little history, so the model flags its band as low confidence.
- That single flag is what sets up the next move for the account team.

From "where am I" to "where is this heading – and what's at risk"

What the Predicted Baseline adds

A committed sum is a snapshot of today. The Predicted Baseline projects each node forward – exposing which parts of the book are accelerating (Midwest EV) and which are steady (Southwest legacy) – so the plan reflects momentum, not just commitments.

How the numbers are built

The baseline is derived off the committed forecast for every SKU, lifted by a plant-level ramp learned from history, then rolled up bottom-up. It never drops below the committed floor, and rolls to **14.73M** for FY26 vs the committed **13.84M**.

◆ Agentforce · Forecast & Risk Agent

Generates the Predicted Baseline curve and confidence band, then flags that the Midwest e-motor ramp is trending **well above committed agreement volume** – a risk a manual sum would hide. It recommends; David decides.
